1.

Suppose your training examples are sentences (sequences of words). Which of the following refers to the $j^{th}$ word in the $i^{th}$ training example?

- $x^{(i)<j>}$

**Correct**

We index into the $i^{th}$ row first to get the $i^{th}$ training example (represented by parentheses), then the $j^{th}$ column to get the $j^{th}$ word (represented by the brackets).

- $x^{<i>(j)}$
- $x^{(j)<i>}$
- $x^{<j>(i)}$

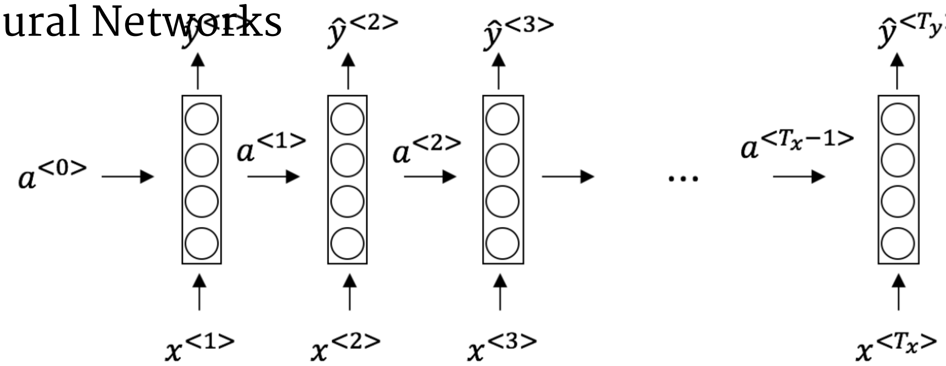
2.

Consider this RNN:

# Recurrent Neural Networks

Quiz, 10 questions

**10/10 points (100%)**



This specific type of architecture is appropriate when:

- $T_x = T_y$

**Correct**

It is appropriate when every input should be matched to an output.

- $T_x < T_y$
- $T_x > T_y$
- $T_x = 1$

1 / 1 points

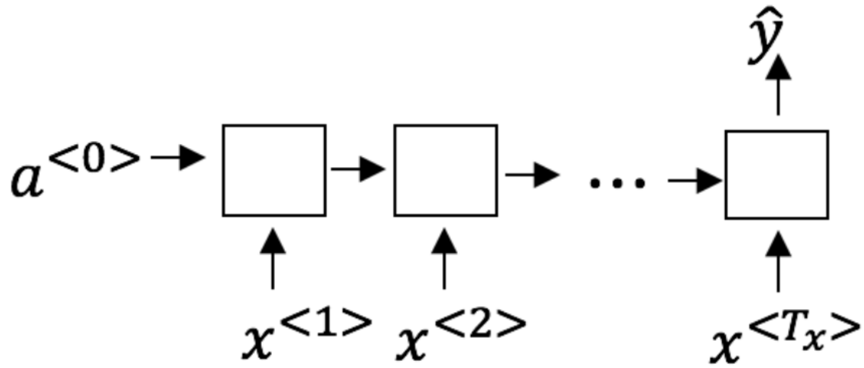
3.

To which of these tasks would you apply a many-to-one RNN architecture? (Check all that apply).

# Recurrent Neural Networks

**10/10 points (100%)**

Quiz, 10 questions



- [ ] Speech recognition (input an audio clip and output a transcript)

**Un-selected is correct**

- [ ] Sentiment classification (input a piece of text and output a 0/1 to denote positive or negative sentiment)

**Correct**
Correct!

- [ ] Image classification (input an image and output a label)

**Un-selected is correct**

- [ ] Gender recognition from speech (input an audio clip and output a label indicating the speaker's gender)

**Correct**
Correct!

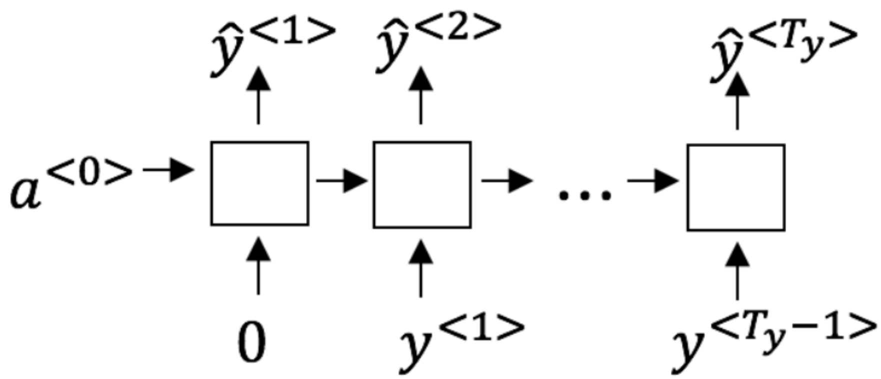
4.

You are training this RNN language model.

# Recurrent Neural Networks

**10/10 points (100%)**

Quiz, 10 questions



At the $t^{th}$ time step, what is the RNN doing? Choose the best answer.

- Estimating $P(y^{<1>}, y^{<2>}, \ldots, y^{<t-1>})$
- Estimating $P(y^{<t>})$
- Estimating $P(y^{<t>} \mid y^{<1>}, y^{<2>}, \ldots, y^{<t-1>})$

**Correct**

Yes, in a language model we try to predict the next step based on the knowledge of all prior steps.

- Estimating $P(y^{<t>} \mid y^{<1>}, y^{<2>}, \ldots, y^{<t>})$

points

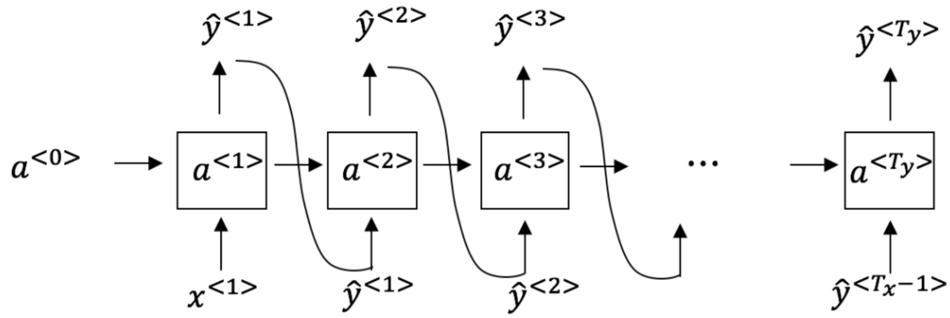
5.

You have finished training a language model RNN and are using it to sample random sentences, as follows:

# Recurrent Neural Networks

**10/10 points (100%)**

Quiz, 10 questions



What are you doing at each time step $t$?

- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass this selected word to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass this selected word to the next time-step.

**Correct**

Yes!

---

1 / 1 points

6.

You are training an RNN, and find that your weights and activations are all taking on the value of NaN ("Not a Number"). Which of these is the most likely cause of this problem?

- Vanishing gradient problem.
- 

Exploding gradient problem.

# Recurrent Neural Networks

**10/10 points (100%)**

Quiz, 10 questions

**Correct**

ReLU activation function g(.) used to compute g(z), where z is too large.

Sigmoid activation function g(.) used to compute g(z), where z is too large.

---

7.

Suppose you are training a LSTM. You have a 10000 word vocabulary, and are using an LSTM with 100-dimensional activations $a^{<t>}$. What is the dimension of $\Gamma_u$ at each time step?

1

100

**Correct**

Correct, $\Gamma_u$ is a vector of dimension equal to the number of hidden units in the LSTM.

300

10000

8.

Here're the update equations for the GRU.

# Recurrent Neural Networks

**10/10 points (100%)**

Quiz, 10 questions

GRU

$$\tilde{c}^{<t>} = \tanh(W_c[\Gamma_r * c^{<t-1>}, x^{<t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[\, c^{<t-1>}, x^{<t>}] + b_u)$$

$$\Gamma_r = \sigma(W_r[\, c^{<t-1>}, x^{<t>}] + b_r)$$

$$c^{<t>} = \Gamma_u * \tilde{c}^{<t>} + (1 - \Gamma_u) * c^{<t-1>}$$

$$a^{<t>} = c^{<t>}$$

Alice proposes to simplify the GRU by always removing the $\Gamma_u$. I.e., setting $\Gamma_u$ = 1. Betty proposes to simplify the GRU by removing the $\Gamma_r$. I. e., setting $\Gamma_r$ = 1 always. Which of these models is more likely to work without vanishing gradient problems even when trained on very long input sequences?

- Alice's model (removing $\Gamma_u$), because if $\Gamma_r \approx 0$ for a timestep, the gradient can propagate back through that timestep without much decay.

- Alice's model (removing $\Gamma_u$), because if $\Gamma_r \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.

- Betty's model (removing $\Gamma_r$), because if $\Gamma_u \approx 0$ for a timestep, the gradient can propagate back through that timestep without much decay.

**Correct**

Yes. For the signal to backpropagate without vanishing, we need $c^{<t>}$ to be highly dependant on $c^{<t-1>}$.

- Betty's model (removing $\Gamma_r$), because if $\Gamma_u \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.

9.

Here are the equations for the GRU and the LSTM:

# Recurrent Neural Networks

Quiz, 10 questions

**10/10 points (100%)**

GRU

$$\tilde{c}^{<t>} = \tanh(W_c[\Gamma_r * c^{<t-1>}, x^{<t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[\, c^{<t-1>}, x^{<t>}] + b_u)$$

$$\Gamma_r = \sigma(W_r[\, c^{<t-1>}, x^{<t>}] + b_r)$$

$$c^{<t>} = \Gamma_u * \tilde{c}^{<t>} + (1 - \Gamma_u) * c^{<t-1>}$$

$$a^{<t>} = c^{<t>}$$

LSTM

$$\tilde{c}^{<t>} = \tanh(W_c[a^{<t-1>}, x^{<t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[\, a^{<t-1>}, x^{<t>}] + b_u)$$

$$\Gamma_f = \sigma(W_f[\, a^{<t-1>}, x^{<t>}] + b_f)$$

$$\Gamma_o = \sigma(W_o[\, a^{<t-1>}, x^{<t>}] + b_o)$$

$$c^{<t>} = \Gamma_u * \tilde{c}^{<t>} + \Gamma_f * c^{<t-1>}$$

$$a^{<t>} = \Gamma_o * c^{<t>}$$

From these, we can see that the Update Gate and Forget Gate in the LSTM play a role similar to _______ and ______ in the GRU. What should go in the the blanks?

- ( ) $\Gamma_u$ and $1 - \Gamma_u$

**Correct**
Yes, correct!

- ( ) $\Gamma_u$ and $\Gamma_r$
- ( ) $1 - \Gamma_u$ and $\Gamma_u$
- ( ) $\Gamma_r$ and $\Gamma_u$

10.
You have a pet dog whose mood is heavily dependent on the current and past few days' weather. You've collected data for the past 365 days on the weather, which you represent as a sequence as $x^{<1>}, \ldots, x^{<365>}$. You've also collected data on your dog's mood, which you represent as $y^{<1>}, \ldots, y^{<365>}$. You'd like to build a model to map from $x \rightarrow y$. Should you use a Unidirectional RNN or Bidirectional RNN for this problem?

- ( ) Bidirectional RNN, because this allows the prediction of mood on day t to take into account more information.
- ( )

Bidirectional RNN, because this allows backpropagation to compute more accurate gradients.

# Recurrent Neural Networks

Quiz, 10 questions

**10/10 points (100%)**

- [x] Unidirectional RNN, because the value of $y^{<t>}$ depends only on $x^{<1>}, \ldots, x^{<t>}$, but not on $x^{<t+1>}, \ldots, x^{<365>}$

**Correct**

Yes!

- [ ] Unidirectional RNN, because the value of $y^{<t>}$ depends only on $x^{<t>}$, and not other days' weather.
